13. ABSTRACT (Maximum 200 words) An electromagnetic wave full-wave solution to the rough surface scattering problem is presented. The mathematical model is derived for vertically and horizontally polarized field components by diffuse single- and double-scatter cross sections of random rough surfaces. The model comprises terms of multidimensional integral expressions. Both physical optics and small perturbation solutions can be obtained from the full-wave model.

SCATTERING AND DEPOLARIZATION BY IRREGULAR LAYERED MEDIA FULL WAVE SOLUTIONS

1 Introduction and Overview

Rigorous closed form solutions for the reflection and transmission of electromagnetic waves have been derived for multilayered dielectric structures of uniform thickness. However, in a large variety of pertinent radio wave propagation problems the thickness of the layers are nonuniform and the height of the interface between two adjacent dielectric layers is a random function. In these cases the incident waves are depolarized and scattered into both propagating and evanescent waves. Furthermore, an incident plane wave may be coupled into guided surface waves and lateral waves of the structure.

Often the problem that is actually solved is a highly idealized version of the original problem and concepts such as "effective dielectric coefficient" and "effective surface impedance" are introduced in order to make the solution of the original problem more tractable. However, the validity of such approximations is very limited and often questionable and they do not necessarily satisfy reciprocity.

Using a full wave approach, it is possible to analyze more realistic models of the original physical structure without introducing simplifying approximations that cannot be justified a priori. The full wave approach is based on the expansion of the electromagnetic fields into a complete spectrum of vertically and horizontally polarized (propagating and evanescent) waves that include the radiation term, the lateral wave and the guided (surface) waves of the structure. Exact boundary conditions are imposed at each irregular interface of the structure and Maxwell's equations are converted into a rigorous set of coupled telegraphists' equations. To this end, precise mathematical procedures are followed and term by term differentiation of nonuniform convergent series is avoided. The coupled telegraphists' equations provide solutions for the forward and backward traveling complex wave amplitudes that are related to the electric and magnetic field transforms. Thus, both near field and far-field solutions can be evaluated. The far fields scattered by the irregular layered structure can be evaluated in closed form in terms of the field transforms by using steepest descent techniques.

2 Research Objectives

1. Determine the full wave like and cross polarized fields scattered by irregular layered structures.
2. Determine the full wave like and cross polarized differential scattering cross sections for irregular layered structures.
3. Determine realistic physical models of the nonspecular reflection and transmission scattering phenomena in layered media. The objective of this phase of the work is to synthesize scattering in complex stratified media from fundamental scattering matrix components.
4. Examine the effects of random rough interfaces with different surface height spectral density functions on the scattered fields.
5. Examine the effects of varying the complex permittivity, permeability and thickness of an intermediate layer in the stratified medium.
6. Examine the suitability of using the "effective dielectric coefficient" and "effective surface impedance" approximations.
7. One of the principal objectives of this research program is to coordinate with researchers at the laboratory facilities of the Chemical Research Development and Engineering Center (CRDEC) a series of experiments that are driven by the analytical results based on the full wave approach.
8. A second major objective of these investigations is to develop computer codes to evaluate the like and cross polarized scattered fields and cross sections using the full wave approach.

In addition to Progress Reports, the Scientific Program Officers were provided with preprints/reprints of Publications (see Section 3) and the computer programs were loaded on CRDEC's computer at the Aberdeen Proving Grounds.

3 List of Publications

3.1 Papers Presented at Technical Meetings

1. 1986 CRDC Scientific Conference on Obscuration and Aerosol Research, Aberdeen, MD, June 23-27, 1986. "Co-Polarized and Cross-Polarized Incoherent Diffuse Specific Intensities for Linearly Polarized Extinction of Irregular Shaped Particles."
2. 1986 CRDC Scientific Conference on Obscuration and Aerosol Research, Aberdeen, MD, June 23-27, 1986. "Excitation Cross Sections and Albedos for Particles with Very Rough Surfaces."
3. 1986 International IEEE-AFS-Symposium and National Radio Science Meeting, University of Pennsylvania, Philadelphia, PA, June 9-13, 1986. "Interpretation of Backscatter Cross Sections for Normal Incidence Using Unified and Two-Scale Full Wave Analysis of Rough Surfaces."
4. 1986 International Union of Radio Science, Commission F Symposium on Wave Propagation: Remote Sensing and Communications, University of New Hampshire, Durham, NH, July 28-August 1, 1986. "Scattering and Depolarization of Linearly Polarized Waves by Finitely Conducting Particles of Irregular Shape."
5. International Union of Radio Science (URSI) Symposium on Electromagnetic Theory, Budapest, Hungary, August 25-29, 1986. "Incoherent Diffuse Scattering by Irregular Shaped Particles of Finite Conductivity."
6. 20th Midwest Symposium on Circuits and Systems, University of Nebraska, Lincoln, NE, August 11-12, 1986. "Application of Full Wave Theory to Computer Aided Geometric Design."
7. Fall 1986 Electromagnetic Wave Propagation Panel Symposium on "Terrestrial Propagation Characteristics on Modern Systems of Communications Surveillance, Guidance and Control," sponsored by Advisory Group for Aerospace Research and Development (NATO), Ottawa, Canada, October 20-24, 1986. "Scattering and Depolarization by Rough Terrain and Vegetation Covered Terrain - Unified Full Wave Approach."
8. International Union of Radio Sciences (URSI) Meeting at the University of Colorado, Boulder, CO, January 12-15, 1987. "Scattering and Depolarization by Layers of Particles with Rough Surfaces Excited at Oblique Incidence."

9. U.S. Army Research Office Workshop on "Propagation in Random Media, Scattering from Rough Surfaces," Washington, D.C., March 23-25, 1987. Invited speaker on "Scattering from Random Rough Surfaces and Random Media Consisting of Irregular Shaped Particles."
10. Spring 1987 Electromagnetic Wave Propagation Panel Specialists' Meeting on Scattering and Propagation in Random Media sponsored by Advisory Group for Aerospace Research and Development (NATO), Rome, Italy, May 18-22, 1987. "Multiple Scattering Effects of Random Distributions of Irregularly Shaped Particles on Infrared and Optical Propagation."
11. 1987 IEEE AP-S International Symposium and URSI Radio Science Meeting, Virginia Tech, Blacksburg, VA, June 15-19, 1987. "Enhancement of Backscatter from Random Rough Surfaces - Full Wave Solution."
12. 1987 CRDEC Scientific Conference on Obscuration and Aerosol Research, Aberdeen, MD, June 22-26, 1987. "Backscatter Enhancement of Infrared and Optical Radiation from Finitely Conducting Particles with Smooth and Very Rough Surfaces - First Order and Multiple Scatter."
13. XIIInd General Assembly of the International Union of Radio Science, Tel Aviv, Israel, August 24-September 2, 1987. "Radar Cross Section of Rough Terrain and Vegetation Covered Terrain." Member of U.S. National Research Council Delegation.
14. International Union of Radio Science (URSI) Meeting at the University of Colorado, Boulder, CO, January 5-8, 1988. "Backscatter Enhancement from Sparsely Distributed Large Particles with Rough Surfaces" with M. A. Fitzwater.
15. 1988 SPIE Technical Symposium on Optics, Electro-Optics and Sensors - Wave Propagation and Scattering in Varied Media, Orlando, FL, April 4-8, 1988. "Scattering and Depolarization by Two-Dimensional Random Rough Surfaces of Finite Conductivity - Theory and Experiment" with M. A. Fitzwater.
16. 1988 IEEE AP-S International Symposium and URSI Radio Science Meeting, Syracuse University, Syracuse, NY, June 6-11, 1988. "Conditions for Coalescence of the Full Wave Solution for Rough Surface EM Scattering with Perturbation and Physical Optics Solutions in the Low and High Frequency Limits - Theory and Experiment."

17. 1988 CRDEC Scientific Conference on Obscuration and Aerosol Research, Aberdeen, MD, June 20-24, 1988. "Non Specular Scattering by Irregular Layered Media - Full Wave Approach."
18. International Geoscience and Remote Sensing Symposium, Edinburgh University, Edinburgh, United Kingdom, September 13-16, 1988. "The Incoherent Like and Cross Polarized Backscatter Cross Sections of an Anisotropic Rough Sea Surface with Swell," (FRA- 211), 1988.
19. International Working Group Meeting on "Wave Propagation in Random Media," Tallin, USSR, September 19-23, 1988. Invited paper "Stokes Parameters for Propagation Media with Random Distributions of Irregular Shaped Particles."
20. International Working Group Meeting on "Wave Propagation in Random Media," Tallin, USSR, September 19-23, 1988. Invited paper "Scattering, Depolarization and Enhanced Backscatter from Random Rough Surfaces."
21. International Union of Radio Science (URSI) Meeting, University of Colorado, Boulder, CO, January 4-6, 1989. "Full-Wave Copolarized Nonspecular Transmission and Reflection Scattering Matrix Elements for Rough Surfaces," with M. A. Fitzwater.
22. IEEE AP-S International Symposium and URSI Radio Science Meeting, San Jose, CA, June 26-30, 1989. "Physical Interpretation of the Full Wave Solutions for the Electromagnetic Fields Scattered from Irregular Stratified Media."

4 Scientific Personnel Associated with this Project and Degrees Awarded During this Reporting Period

Professor Ezekiel Bahar was the Principal Investigator and Dr. M.A. Fitzwater was a Research Associate for the first two years.

M.S. degrees were awarded to Guorong Huang and S.M. Haugland. R.D. Kubik is nearing the completion on his Ph.D. degree requirements and T. Guminski is nearing the completion of his M.S. degree requirements.

M.S. Thesis by Guorong Huang completed May 1990, titled, "Transmission Scattering and Depolarization of Electromagnetic Waves Across Rough Interfaces Full Wave Approach."

M.S. Thesis by S.M. Haugland completed May 1991, titled, "Scattering of Electromagnetic Waves From Coated Rough Surfaces."

T. Guminski (expected graduation Summer 1993), Title of M.S. Thesis: "Scattering from Surfaces with Non-Gaussian Statistics."

R.D. Kubik (expected graduation Summer 1993), Title of Ph.D. Dissertation: "Scattering and Depolarization upon Transmission and Reflection from Multilayered Structures."

During the period June 12, 1986 and September 30, 1988, Robert Frickel was the Scientific Program Officer. The Scientific Program Officer during the period of contract renewal October 1, 1988 and April 12, 1992 was Dr. A. Carrieri.

OUTLINE OF RESEARCH FINDINGS

The electromagnetic fields scattered by irregular stratified media consisting of three layers characterized by complex permittivities ϵ_n and permeabilities μ_n ($n=0,1,2$) (see Fig. 1) were derived. The interface between media 0 and 1 is the planar surface $y=0$ while the interface between media 1 and 2 is the rough surface $y=h(x)$ where $h(x)$ is either a deterministic or random function of the variable x . The electromagnetic sources are assumed to be magnetic or electric line sources \bar{J}_m and \bar{J}_e parallel to the z axis. These sources excite vertically (V), and horizontally (H) polarized waves respectively with respect to the interface $y=0$. The line sources are assumed to be at large distances from the surface $y=0$, thus the incident waves are assumed to be plane waves in the direction

$$\bar{n}^i = \sin\theta_o^i \bar{a}_x - \cos\theta_o^i \bar{a}_y \equiv S_o^i \bar{a}_x - C_o^i \bar{a}_y \quad (1)$$

Complex time harmonic excitations $\exp(i\omega t)$ are assumed throughout this work. Since this problem is two dimensional, the direction of the scattered waves is given by

$$\bar{n}^f = \sin\theta_o^f \bar{a}_x + \cos\theta_o^f \bar{a}_y \equiv S_o^f \bar{a}_x + C_o^f \bar{a}_y \quad (2)$$

The approximate surface impedance Z_s (admittance Y_s) is also used to characterize the medium $y < h(x)$ and the expressions for the scattered fields are compared with the corresponding expressions for the three media problem.

The observation point (x,y) is assumed to be very far from the surface $y=0$ ($k_o(x^2+y^2)^{1/2} \equiv k_o\rho \gg 1$), therefore only the scattered radiation fields are considered in this work.

The electric (e) and magnetic (m) z directed line source \bar{J}_ℓ of intensity I_ℓ ($\ell=e,m$) can be expressed as follows in terms of the Dirac delta functions $\delta(\cdot)$;

$$\bar{J}_\ell = I_\ell \delta(x-x_o) (y-y_o) \bar{a}_z \quad (3)$$

in which $k_o(x_o^2 + y_o^2)^{1/2} = k_o\rho_o \gg 1$.

Using the full wave approach, it can be shown that the scattered vertically (V) and horizontally (H) polarized waves can be expressed in terms of their z directed magnetic and electric fields respectively (Bahar 1973a,b).

The corresponding scattered electric and magnetic fields are

$$\bar{E}^{Vf} = \eta_o H_z^f \bar{a}_z \times \bar{n}^f, \quad \bar{H}^{Hf} = \bar{n}^f \times E_z^f \bar{a}_z / \eta_o \quad (4)$$

in which

$$\eta_n = \sqrt{\mu_n / \epsilon_n} \quad (n=0,1,2) \quad (5)$$

is the intrinsic impedance for medium n . The z component of the scattered fields can be expressed as follows in matrix form

$$G^f = G_o S G^i \quad (6)$$

where the coefficient G_o is

$$G_o = \left(\frac{1}{2\pi k_o \rho} \right)^{\frac{1}{2}} \exp(i\pi/4) \exp(-ik_o \rho) \quad (7)$$

in which

$$k_n = \omega(\mu_n \epsilon_n)^{\frac{1}{2}} \quad (8)$$

is the wavenumber for medium $n=0,1,2$.

The amplitude of the incident z directed magnetic or electric field at the origin is

$$G_\ell^i = -\frac{1}{2} \left(\frac{1}{2\pi k_o \rho_o} \right)^{\frac{1}{2}} \exp(i\pi/4) \exp(-k_o \rho_o) \cdot \begin{cases} \omega \epsilon_o I_m \\ \omega \mu_o I_e \end{cases} \quad (9)$$

in which G_ℓ^i is the element of the 2×1 column matrix

$$G^i = \begin{bmatrix} G_m^i \\ G_e^i \end{bmatrix} \equiv \begin{bmatrix} H_z^i \\ E_z^i \end{bmatrix} \quad (10)$$

Similarly, G^f is a 2×1 column matrix with elements G_ℓ^f equal to the z component of the scattered magnetic and electric fields

$$G^f = \begin{bmatrix} G_m^f \\ G_e^f \end{bmatrix} \equiv \begin{bmatrix} H_z^f \\ E_z^f \end{bmatrix} \quad (11)$$

The elements of the scattering matrix S are $S^{PQ}(P, Q=V \text{ or } H)$. In view of the two dimensional nature of the problem, the scattered waves are not depolarized and

$$S^{VH} = S^{HV} = 0 \quad (12)$$

and S is a diagonal matrix

$$S = \begin{bmatrix} S^{VV} & 0 \\ 0 & S^{HH} \end{bmatrix} \quad (13)$$

The diagonal terms can be expressed as follows:

$$S^{PP} = S_{oo}^{PP} I_{oo} + S_{11}^{PP} \sum_{p=1}^{\infty} \sum_{q=1}^{\infty} I_{pq}^{PP} \quad (14)$$

in which the first term represents scattering due to the interface $y=0$ only and the double summation (over p and q) represents multiple scattering in the intermediate layer ($0 \geq y \geq h(x)$ and $-L \leq x \leq L$).

$$S_{00}^{VV}(\theta^f, \theta^i) = \frac{2c_o^f c_o^i \{[(\mu_1/\mu_o)c_1^f c_1^i - s_o^f s_o^i][1 - (\epsilon_o/\epsilon_1)] + [1 - (\mu_1/\mu_o)]\}}{[c_o^f + c_1^f(\eta_1/\eta_o)][c_o^i + c_1^i(\eta_1/\eta_o)][c_o^f + c_o^i]} \quad (15)$$

where in accordance to Snell's law:

$$k_o s_o^i = k_n \sin \theta_n^i \equiv k_n s_n^i \text{ and } k_o s_o^f = k_n \sin \theta_n^f \equiv k_n s_n^f \quad (16a)$$

and

$$c_n^i = [1 - (s_n^i)^2]^{1/2}, \quad c_n^f = [1 - (s_n^f)^2]^{1/2}, \quad \text{Im}(c_n^i) \geq 0, \quad \text{Im}(c_n^f) \geq 0 \quad (16b)$$

Furthermore

$$I_{00} = \int_{-L}^L \exp[ik_o(s_o^f - s_o^i)x] k_o dx = 2k_o L \text{sinc } k_o(s_o^f - s_o^i)L \quad (17)$$

where $\text{sinc}(\alpha) = \sin(\alpha)/\alpha$. For $p \geq 1$ and $q \geq 1$

$$S_{pq}^{VV}(\theta^f, \theta^i) = \frac{2c_1^f c_1^i \{[(\mu_2/\mu_1)c_2^f c_2^i - s_1^f s_1^i][1 - (\epsilon_1/\epsilon_2)] + [1 - (\mu_2/\mu_1)]\}}{[c_1^f + c_2^f(\eta_2/\eta_1)][c_1^i + c_2^i(\eta_2/\eta_1)][c_1^f + c_1^i]} \cdot T_{10}^V(\theta^f) T_{10}^V(\theta^i) \eta_1/\eta_o \quad (18)$$

and

$$I_{pq}^{VV} = \frac{[R_{01}^V(\theta^f) R_{21}^V(\theta^f)]^{p-1} [R_{01}^V(\theta^i) R_{21}^V(\theta^i)]^{q-1} [c_1^f + c_1^i]}{(2p-1)c_1^f + (2q-1)c_1^i} \cdot \int_{-L}^L \exp\{ik_1(s_1^f - s_1^i)x + ik_1[(2p-1)c_1^f + (2q-1)c_1^i]h(x)\} k_o dx \quad (19)$$

in which R_{01}^V and R_{21}^V are the Fresnel reflection coefficients for vertically polarized waves incident from medium 1 to medium 0 and from medium 1 to medium 2 respectively. The transmission coefficient T_{10}^V is for vertically polarized waves incident from medium 0 to medium 1. When the approximate impedance boundary condition is used at the interface $y=h(x)$ instead of the exact two media boundary conditions S_{pq}^{VV} in (18) is given by

$$S_{pq}^{VV} = \frac{2c_1^i c_1^f (1 - s_1^f s_1^i - z_s^2)}{(c_1^f + z_s)(c_1^i + z_s)(c_1^f + c_1^i)} T_{10}^V(\theta^f) T_{10}^V(\theta^i) \eta_1/\eta_o \quad (20)$$

in which z_s is the normalized surface impedance

$$z_s = Z_s/\eta_1 = \eta_2/\eta_1 \quad (21)$$

For scattering in the specular direction ($\theta^f = \theta^i$)

$$S_{oo}^{VV}(\theta^i, \theta^i) = 2C_o^i R_{1o}^V(\theta^i) \quad (22)$$

and

$$S_{pq}^{VV}(\theta^i, \theta^i) = 2C_1^i R_{21}^V(\theta^i) T_{1o}^V(\theta^i) T_{1o}^V(\theta^i) \eta_1 / \eta_o \quad (23)$$

The above full wave solutions for the scattered radiation fields satisfy the reciprocity and duality relationships in electromagnetic theory. They should not be confused with a geometric or physical optics solution to the problem Schlak and Wait (1968). The corresponding scattering coefficients for the horizontally polarized waves S_{pq}^{HH} can be obtained directly for the above expressions for S_{pq}^{VV} on interchanging the permittivity ϵ with the permeability μ and the surface impedance z_s with its reciprocal; surface admittance y_s .

OUTLINE OF RESEARCH FINDINGS

Computer codes were developed to evaluate the scattered vertically and horizontally polarized fields for irregular layered media (See Report #1) Medium 1 ($0 < y < h$) is represented by the permittivity of a thin film of liquid while medium 2 is represented by the permittivity of foilage or a painted metal surface. Both the solutions for the three media problem as well as the solution involving the approximate impedance boundary condition are considered. The convergence of the series expansion of the solution was studied for dissipative and non-dissipative media. Special attention is given to the determination of the effects of the thin liquid film covering the rough surface of the substratum $y > h$. (See Fig. 1).

During the following reporting periods the following analytical and numerical work will be done:

- (i) Transformation to a local coordinate system will be used to account for the slopes of the rough interface $y=h(x)$.
- (ii) Special consideration will be given to random rough surfaces.
- (iii) Solutions for the coherent and incoherent scattered powers will be derived.
- (iv) Additional work will be done to more closely represent the permittivities of the liquid film and the substratum.
- (v) Generalization of the analytical results to three dimensional scattering problems including depolarization: (a) Point sources, (b) Three dimensional incident and scattered wave normals \vec{n}^i and \vec{n}^s , (c) Two dimensionally rough surfaces $h(x,z)$.

OUTLINE OF RESEARCH FINDINGS

During this reporting period (January 1-March 31, 1987) the principal investigator presented two papers at technical meetings and submitted five papers to professional/technical journals for review. Two papers were accepted for publication and three papers were published in the Professional/Technical literature (see Item #7 and enclosures).

Additional work was done on the development of computer codes to evaluate the vertically and horizontally polarized waves scattered by irregular layered media (See Report #1). These codes are being tested at various frequencies of excitations for both dissipative and non-dissipative media. Particular attention is given to the electrical characteristics (complex permittivity) of the intermediate layer (medium 1, see Fig. 1) at optical and infrared frequencies. The effects of varying the thickness of this layer are also of special interest.

Progress is also being made with the analytical development of this research project as described in the Outline of Report #2. Thus, the transformation of the analytical results for media with deterministic rough interfaces to structures with random rough interfaces is being carefully studied.

OUTLINE OF RESEARCH FINDINGS

During this reporting period (April 1 - June 30, 1987), the principal investigator presented three papers at technical meetings and submitted one paper to professional/technical journals for review. Three papers were accepted for publication and two were published in the professional/technical literature (see Item #7 and enclosures).

Significant progress has been made on the physical interpretation of the full wave solutions for the electromagnetic fields scattered from irregular stratified media. The full wave solutions for the vertically and horizontally polarized electromagnetic fields scattered by irregular stratified media are expressed in terms of double infinite sums. These full wave solutions satisfy the reciprocity relationships in electromagnetic theory. The physical interpretation of each term in the double infinite series provides insights into the nonspecular scattering phenomena for irregular stratified media. It is shown that $n+1$ different terms of the full wave expansion replace the single n th term of the corresponding geometric optics series (see Fig. 1). For scattering in the specular direction these $n+1$ terms become analytically indistinguishable and the full wave solution reduces to the geometric optics solution. The full wave solutions are also consistent with Rice's perturbation solution for rough surface scattering in the low frequency limit. The physical interpretation of the full wave solutions which are based on complete spectral expansions of the fields could be used to construct solutions for the non-specularly scattered fields in complex problems involving irregular stratified media. Details of this work are presented in the attached manuscript (see Item #7.2(i) of this quarterly report).

For irregular stratified media it is necessary to consider both nonspecular reflection from rough surfaces as well as nonspecular transmission across rough surfaces. Specular transmission (analogous to specular reflection) corresponds to refraction of the incident wave across a plane interface in accordance with Snell's law. Progress has been made in obtaining the full wave solutions for scattering across rough interfaces. Details will be worked out during the next reporting period (July 1 - September 30, 1987).

Outline of Research Findings

During the reporting period (July 1 - September 30, 1987), the principal investigator presented an invited paper at the XXII General Assembly of the International Union of Radio Science on "Radar Cross Section of Rough Terrain and Vegetation Covered Terrain." See Item (7.1)(i). The principal investigator was an official U.S. delegate appointed by the U.S. National Research Council.

Four technical/scientific manuscripts were prepared and submitted for publication--see Item (7.2)(i)-(iv) (preprint of Item (7.2)(i) enclosed).

One paper was accepted for publication by the Journal of the Optical Society of America--see Item (7.3)(i).

Two papers were published in the professional/technical literature--See Item (7.4)(i) and (ii) (reprints enclosed).

Electromagnetic waves in irregular layered media are scattered upon reflection as well as transmission across an interface. Full wave solutions were derived for the nonspecular diffuse scattering upon transmission across an irregular interface between two media. The solutions were shown to agree in the high frequency limit with the physical optics solutions (based on the Kirchhoff approximations of the surface fields) when scattering is primarily near-specular. It also agrees, in the low frequency limit with the perturbation solutions when the root mean square height of the rough surfaces is small compared to the wavelength of the electromagnetic wave and when the mean square slopes of the rough surface are small compared to unity. The full wave solutions are shown to satisfy the realizability, reciprocity and duality relationships in electromagnetic theory and they are invariant to coordinate transformations.

Thus using the full wave approach, the rough surface is characterized by a (2×2) differential scattering matrix whose elements are the differential reflection and transmission scattering coefficients for an elementary surface element when the excitation is from above or below the surface element of the irregular interface (see Fig. 1). Details of this work are provided in the attached pre-print Item # (7.2)(i).

Significant progress is also being made on scattering upon reflection and transmission in irregular stratified media.. Details will be presented in Progress Report #6 (October 1-December 31, 1987).

A comprehensive proposal has been submitted to the sponsor of this research project for the extension of the current contract beyond its current expiration date in September 1988.

Outline of Research Findings

During the reporting period (October 1 - December 31, 1987), the principal investigator prepared two papers for publication and review (preprint of Item (7.2) (ii), enclosed). One paper was accepted for publication in the Journal of Wave Material Interaction - see Item (7.3) (i) and one paper was published in the professional/technical literature (see Item (7.4) (i), reprint enclosed). The principal investigator will present a paper on "Backscatter Enhancement from Sparsely Distributed Large Particles with Rough Surfaces" at the International Union of Radio Science NRC Meeting, University of Colorado, Boulder, January 5-8, 1988.

Significant progress has been made on scattering upon reflection and transmission in irregular stratified media (see Fig. 1). A physical interpretation is given to each term in the full wave expansion of the vertically or horizontally polarized electromagnetic fields scattered by irregular stratified media (see Fig. 2). These solutions provide a basis for the construction of physical models of nonspecular scatter in complex irregular layered structures. The full wave solutions involve a pair of nonspecular reflection scattering coefficients (F_{00}^P and F_{11}^P) and a pair of nonspecular transmission scattering coefficients (F_{01}^P and F_{10}^P) that reduce to the familiar Fresnel reflection and transmission coefficients for the specular case.

For the special case of parallel stratified media, the total solution expressed in terms of a single reflection term, two infinite sums as well as a double infinite sum, reduces to the closed form solution for reflection of electromagnetic waves from uniform layered media. The full wave solutions are shown to satisfy the reciprocity and duality relationships in electromagnetic theory and they are invariant to coordinate transformations. The relationships between the full wave solution and the high frequency physical optics solution and the low frequency perturbation solutions are also demonstrated. The analysis is relevant to problems of communication in irregular stratified media and to problems of remote sensing.

Outline of Research Findings

During the reporting period (January 1 - March 31, 1988), the principal investigator presented a paper on "Backscatter Enhancement from Sparsely Distributed Large Particles with Rough Surfaces" at the International Union of Radio Science NRC Meeting at the University of Colorado, Boulder, January 5-8, 1988 (see Item 7.1a). Three additional papers were accepted for presentation at Scientific Meetings (see Item 7.1b). The principal investigator prepared two papers for publication and review (see Item 7.2). One paper was accepted for publication (see Item 7.3) and one paper has been published in the professional/technical literature (see Item 7.4).

A complete analytical solution to the problem of electromagnetic propagation in irregular (three) layered media has been derived in terms of integrals over the nonplanar interfaces, between the different layers of the propagation media. The solutions obtained for the deterministic problem is currently being applied to problems in which the interfaces are characterized statistically by their joint surface height probability density functions. During the next reporting period (July 1988), a new graduate student will be assigned full time to develop computer codes to evaluate the radar cross sections for different irregular three layered propagation problems.

During this summer Mr. Craig Herzinger, a University of Nebraska-Lincoln graduate, will work with Dr. A. Carriere on the implementation of the computer codes (supplied by our research group to CRDEC) on their supercomputer. In the future, we plan to network directly (from Lincoln, Nebraska), with their computer facility.

Outline of Research Findings

During the reporting period (April 1 - June 30, 1988), the principal investigator presented three papers at Scientific/Technical Meetings (see Item 7.1a). Two additional papers were invited for presentation at the International Working Group Meeting on Wave Propagation in Random Media (see Item 7.1b). Two papers were submitted for review (see Item 7.2) and two papers were accepted for publication in Scientific/Technical Journals. One paper on Enhancement of Backscattered Diffuse Specific Intensities has been published in the Journal of the Optical Society of America (see Item 7.4). A reprint of this article is attached to this report.

In order to apply the full wave analysis of electromagnetic scattering in irregular (three) layered media to three dimensional problems, closed form expressions are derived for the co- and cross-polarized transmission scattering coefficients at a rough interface. Since this phase of the analysis accounts for coupling between the vertically and horizontally polarized waves, more realistic models of irregular multilayered media can be analyzed using the full wave approach. The full wave approach is shown to satisfy the duality and reciprocity relations in electromagnetic theory. This analysis can be used to evaluate the co-polarized and cross-polarized scattering cross sections as well as all the elements of the Stokes Matrix.

Mr. Craig Herzinger, a University of Nebraska Graduate, is currently working with Dr. A. Carriere at the CRDEC on the computation of the Stokes Matrix for random rough surfaces. The results of these computations will be used to determine the elements of the Stokes Matrix that are most sensitive to variations in the rough surfaces parameters.

Outline of Research Findings

During the reporting period (July 1, 1988 - September 30, 1988), the principal investigator presented two (2) papers at Scientific/Technical Meetings (see Item 7.1a). A paper on nonspecular transmission and reflection at a rough interface has been accepted for presentation at the URSI Meeting in Boulder, Colorado (see Item 7.1b). One paper was submitted (Item 7.2) and two papers were accepted for publication in Scientific/Technical Journals (Item 7.3). Reprints of two papers that were published in the Journal of Wave-Material Interaction and in the Proceedings of the SPIE 1988 Technical Symposium (Item 7.4) are attached to this report.

Full wave expressions for the co-polarized and cross-polarized transmission scattering coefficients at a rough interface between two electromagnetic media (ϵ, μ) have been derived for arbitrary incident and scatter directions. Thus the incident and scatter planes are not necessarily co-planar. When the mean square height and slopes of the rough surface are very small ($k_0^2 \langle h^2 \rangle \ll 1, \sigma_s^2 \ll 1$) the expressions have been shown to be in agreement with the corresponding expressions obtained using the small perturbation analysis. These transmission scattering coefficients are used in the three-dimensional analysis of electromagnetic scattering by irregular layered media.

During the reporting period, Mr. Craig Herzinger installed a full wave computer code (in the CRDEC supercomputer) for the evaluation of the elements of the Stokes matrix for electromagnetic (including optical) backscatter from rough surfaces. Craig was commended by Dr. Arthur A. Carrieri for the software development and the graphical analysis of the Full Wave light scattering models (see enclosure).
